API conventions

English version of ../../api/conventions.md. The live specification is the Swagger UI at /docs and /openapi.json of a running backend. Error codes are in ERROR_CODES.md.

Rules

Rule	Detail
Format	JSON, FastAPI + Pydantic 2
Authentication	JWT (local) or Keycloak Authorization Code Flow + PKCE; roles admin / manager
Liveness	/healthz (process), /readyz (readiness, including the database)
Idempotency	import from LMS/CMS — by contract_number; a repeated import creates no duplicate
Business constraint	a university has at most 2 active interactions — enforced on the backend, not in the UI
Errors	one schema from ERROR_CODES.md, a machine-readable code plus a human message

Trust boundaries

- The role is checked on the backend; the UI hides elements but is not a protection.
- Secrets (GigaChat, Keycloak, MinIO) never appear in API responses; test_security_headers.py and test_cors.py pin the headers and the CORS policy.

How to change the API

1. Change the router and the schema. 2. Update frontend/src/api/*. 3. Run make test lint typecheck. 4. Add a row to verification/matrix.md if a new claim appeared.
