Portability audit — 2026-10-29

English version of ../../audit/portability-audit-2026-10-29.md.

What was already in good shape

Area	Observation
Documentation	docs/architecture/ with C4 diagrams, an ER model, Archimate; ADMIN_GUIDE, USER_GUIDE, SECURITY, SAST-SCA
Tests	23 files, running on SQLite without an external database (conftest.py), including test_schema_sync.py
Migrations	Alembic, the revision in the repository, consistency checked against the models
CI	backend (tests, ruff, mypy), frontend, plus a duplicate description for SourceCraft
Readiness	/healthz and /readyz are separate — correct semantics
Compose	the whole contour (backend, frontend, nginx, keycloak, redis, minio) with one command

Gaps and what was done

#	Gap	Impact	Closed by
1	No `Makefile`	commands scattered across README/DEPLOYMENT	a `Makefile` with 18 targets
2	No host check	configuration errors were caught after start-up	`scripts/doctor.sh`
3	No `smoke-test`	nothing to verify readiness with after a deployment	`scripts/smoke-test.sh` (`/healthz`, `/readyz`, `/docs`, `/openapi.json`, the frontend)
4	No documentation completeness check	documents rot silently	`scripts/docs-check.sh`
5	**The organisation README's clone instructions pointed at `Pavel1778/rtk-crm`**	the clone does not match the current home	the link was fixed to `ForgeLabHub`
6	`docs/README.md` claims that Keycloak/Redis/Nginx are "future options", while the base compose starts them	the document and reality diverge	an honest description in `docs/operations/deployment.md` + `make compose-up SERVICES="..."` for a minimal set
7	CI did not check migrations from scratch, a repeated `upgrade`, backup/restore or the full compose	portability was not proven	`portability.yml`
8	No module specifications	boundaries were not verifiable	`docs/modules/*` + a template + a CI check
9	No "claim → check" matrix	proven and promised could not be told apart	`docs/verification/matrix.md`
10	Two CI descriptions (GitHub and SourceCraft)	risk of the checks diverging	recorded in the matrix as not automatically verifiable

What remains open

- Demo passwords in the README (`admin123`, `manager123`) — acceptable for a case prototype, unacceptable in production: `scripts/anonymize_case_data.py` for anonymisation.
- No `/metrics`: observability rests on logs and health checks.
- No load tests (`tests/load` is a stub).
- The "2 active interactions" limit is not protected by a database schema constraint.
