Module specification: template

English version of ../../modules/module-template.md. Copy this into `docs/modules/<name>.md`. All 11 sections are mandatory — `scripts/docs-check.sh` verifies their presence in CI.

1. Purpose and boundaries

What the module does, what it does not do, where its responsibility ends.

2. Use cases

User/system → what happens → what is observable, including failures.

3. Contract

Routes, schemas, events, error codes; a reference to `backend/openapi.json`.

4. Data

Which tables/files the module writes (as the single writer) and what it reads through other modules' contracts. Snapshot, aggregates, provenance.

5. Permissions

Who has access, what happens on denial, how that is verified.

6. Dependencies

Inbound (who calls it) and outbound (what it calls), a port/adapter for an external system.

7. Configuration

`AEZA_*` variables with defaults, whether they are mandatory, and the consequences of a wrong value.

8. Build and debugging

How to run this module alone, how to reproduce the behaviour locally.

9. Tests

Which tests prove what (files, test names).

10. Observability

Logs, metrics, error codes, what the operator does on failure.

11. Limitations and readiness

Known limitations, what is deliberately not done, readiness criteria.
